Milestone 2 — Application Development Progress Report

Members: Jann Arpon, Jezriel Sia, Ethan Anggot

Project Overview

SEC Grab-N-Go is a proposed mobile food-ordering application for stalls at Xavier Ateneo SEC Mall. Milestone 2 focused on implementing the major user interfaces, enabling navigation between screens, and demonstrating the ordering workflow using Apache Cordova.

Completed Features

1.Welcome, login, registration, customer home/stall directory, and profile interfaces.

2. Stall menu browsing, stall search, shopping cart, quantity controls, and checkout form.

3. One-stall-per-checkout restriction, with confirmation before replacing items from another stall.

4.Stall-specific QR Ph payment screen with a clearly marked non-scannable placeholder.

5. Simulated payment success/failure flow, order confirmation, and My Orders history.

6. Demonstration vendor dashboard showing orders for the selected stall and status updates: Confirmed, Preparing, Ready for Pickup, and Completed.

7. Android debug APK generated successfully using Cordova.

What remains to be developed

1.Real account registration, login, and user authentication.

2.Backend/database storage and persistent order management.

3.Actual QR Ph integration and payment verification through an authorized provider.

4.Secure vendor access and real-time delivery of confirmed orders to vendors.

5.Android device runtime testing and further usability validation.

Problems encountered and how we addressed them

Problem	**Solution**
PowerShell blocked the cordova.ps1 script	Ran cordova.cmd build android which then resulted to build completed successfully.
Repeated navigation previously caused interface freezing.	We changed some JavaScript event-listener placement to prevent duplicate handlers that resulted to unresponsiveness
some buttons were not functional	Rechecked the html files and resolved it with the correct code

Css did not function properly	Matched the name of the css file to the link in index.html
Emulator was extremely slow	Used a physical android device to test the project.
